

CLIENT DEMONSTRATION GUIDE

BookMyLoad

End-to-End Transport & Logistics Operations

Prepared from the current application - August 2026

What BookMyLoad solves

One operating system for the transport lifecycle

- Plan - Capture customers, locations, loads and quotations.
- Execute - Allocate vehicles and drivers; control milestones and delivery proof.
- Control - Track compliance, expenses, collections and profitability.
- Learn - Use live dashboards, reports and exports to improve decisions.

Logistics basics

Shared language for the demonstration

- Transporter: A company or partner that moves goods. It may use its own fleet or an external carrier.
- Customer / Shipper: The business requesting goods movement and paying for the service.
- Load: The commercial movement request: cargo, weight, pickup, delivery, dates and price.
- Trip: The execution record created when a load is assigned to a driver and vehicle.
- Consignee / Recipient: The person or business receiving the cargo at destination.
- POD: Proof of Delivery: recipient identity plus OTP, signature or photo confirming handover.

Core records and how they connect

A simple operating data model

Organization > Customer + Locations > Load > Trip > Driver + Vehicle > POD > Invoice + Payment

Compliance documents, GPS updates, notifications and expenses attach to this chain.

Application architecture

Modern, portable and production-ready foundations

- Frontend:

- React web application
- Responsive operations workspace
- Mobile-focused driver portal
- OpenStreetMap / Leaflet views

- Backend:

- FastAPI REST API
- Google Sign-In and secure session cookie
- Role and permission enforcement
- Background reminder worker

- Data & deployment:

- SQLite for local demo
- PostgreSQL supported for shared production
- SQLAlchemy + Alembic migrations
- API documentation at /docs

Run the application locally

Two terminals, then open the browser

1 Backend (PowerShell)

cd backend

```
.\.venv\Scripts\python.exe -m pip install -r requirements.txt
```

```
.\.venv\Scripts\python.exe -m alembic -c alembic.ini upgrade head
```

```
.\.venv\Scripts\python.exe -m uvicorn server:app --reload --host 127.0.0.1 --port 8000
```

2 Frontend (second terminal)

cd frontend

```
npm install --legacy-peer-deps
```

```
npm start
```

3 Open

Web: <http://localhost:3000>

API docs: <http://localhost:8000/docs>

Prerequisites: Python 3.11+, Node.js 20+, configured Google OAuth client ID. Restart after environment changes.

Sign-in and organization access

Identity first, tenant isolation by design

- Users sign in with Google; the application verifies the credential on the backend.
- The first verified user creates the first organization and becomes Organization Owner.
- Later users must be invited for their exact Google email address.
- Users with multiple memberships can switch organizations from the sidebar.
- All operational and reporting queries are restricted to the active organization.

Roles and permissions

Five experiences, controlled at the API

Role | Typical user | Access summary

Organization Owner | Business owner / super admin | All features, organization and member management

Operations Admin | Transport manager | Manage fleet, drivers, loads, trips, compliance, finance, costs and reports

Dispatcher | Control-room operator | Manage loads/trips; view resources, compliance and finance; create/update expenses

Viewer | Management / auditor | Read-only operational, financial and reporting access

Driver | Assigned driver | Own trips, inspections, milestones, location, POD, documents and expenses

Navigation map

Every workspace in the operations application

- Command:

- Overview

- Operations:

- Loads
- Trips
- Live tracking

- Resources:

- Fleet
- Drivers
- Compliance

- Business:

- Finance
- Trip costs
- Reports

- Account:

- Notifications
- Settings
- Organization switcher
- Profile / logout

Overview tab

The morning control-tower view

- Active trips and trips completed today
- Available vehicles and available drivers
- 30-day profit and margin
- Recent trip movements and execution-status mix
- Items needing attention: delayed work, unpaid invoices, compliance, approvals
- Revenue, approved costs and on-time delivery summary

Loads tab

Where customer demand becomes executable work

- Master data:

- Create customers
- Add pickup/delivery locations
- Search or pick locations on a map
- Register optional external transporters

- Load details:

- Reference and customer
- Cargo type, quantity and weight
- Pickup time and delivery deadline
- Quoted amount, transporter and handling notes

- Lifecycle:

- Draft -> Submitted
- Approved -> Scheduled
- Allocate -> In execution
- Delivered -> Closed
- Reject or cancel when required

What is a transporter?

Own-fleet and partner-carrier operations

- A transporter is the organization physically responsible for moving goods.
- BookMyLoad can operate with the company's own drivers and vehicles.
- An external transporter can also be registered with contact details and service areas.
- The transporter is optional on a load, allowing mixed own-fleet and outsourced operations.

Fleet tab

Vehicle master and availability control

- Add or edit registration number, vehicle type, make, model and year.
- Record capacity in tons, fuel type and current location.
- Search the fleet and change status: Available, In Transit, Maintenance or Offline.
- Only available, capacity-compatible and compliant vehicles should be allocated.
- Vehicle documents are maintained in the Compliance workspace.

Drivers tab

Driver master, readiness and app invitation

- Create driver profile with phone, email, licence number and expiry.
- Store address and emergency contact.
- Set availability: Available, On Trip, Off Duty or On Leave.
- View rating and total-trip indicators.
- Invite the driver's Google email to link the profile to the driver portal.
- Expired licence or critical compliance failures can block allocation.

Trips tab

Dispatch and operational execution

- Trips are created by allocating a scheduled load, or can be created directly.
- Assign an available driver and vehicle.
- Search and filter trips by status.
- Review route, cargo, schedule, customer and assignment.
- Control assignment/start/completion states from operations.
- Linked load status updates automatically as execution progresses.

Driver portal

A focused mobile workflow for the person on the road

Only trips assigned to the linked driver profile are visible.

Pre-trip checks cover tyres, brakes, lights, mirrors and vehicle documents.

Milestones are ordered: pickup arrival, loading, pickup departure, destination arrival.

POD requires recipient plus at least one of OTP, signature or photo.

Drivers can call the customer and record delivery/damage/shortage notes.

Live Tracking tab

Operational visibility without a paid map dependency

- Browser geolocation sends sampled GPS points during in-progress trips.
- OpenStreetMap shows vehicle marker, route history and pickup/destination context.
- Refreshes every 15 seconds and shows GPS accuracy, speed and update age.
- Stale/no-signal alerts surface exceptions.
- 500-metre geofences suggest milestones; the driver still confirms the event.

Compliance tab

Documents, verification and allocation safeguards

- Driver documents:

- Driving licence
- Identity / medical records

- Vehicle documents:

- Registration
- Insurance and fitness
- Pollution and permits

- Control features:

- PDF/image upload, max 5 MB
- Pending / verified / rejected
- Valid / expiring in 30 days / expired
- Preview, verify, reject and delete

Expired or rejected critical documents—and expired driver licences—can block trip allocation.

Finance tab

Quotation to collection

Itemized quotation: base freight, fuel, toll, handling, tax, validity and terms.

Accepted quotation updates the load's quoted amount.

Invoices are created only for delivered/closed loads.

Supports partial payment and outstanding balance.

Methods: bank transfer, UPI, cash, cheque or other; reference/UTR can be stored.

Due dates and overdue status support collection follow-up.

Trip Costs tab

Expense approval and load-level profitability

- Categories include fuel, toll, parking, allowance, transporter, loading, unloading, repair, fine and miscellaneous.
- Capture estimated amount, actual amount, vendor, date and reference.
- Attach an optional PDF/image receipt.
- Workflow: Draft -> Submitted -> Approved or Rejected.
- Only approved actual costs reduce realized profit.
- Profit uses pre-tax invoice revenue, then accepted quotation/load price as fallback.

Reports tab

Live operations and financial analytics

- Filters:

- Date range
- Customer, driver, vehicle
- Load and invoice status
- Expense category

- KPIs:

- Loads and completion
- On-time delivery
- Revenue and collections
- Outstanding, cost, profit and margin

- Analysis & output:

- Customer performance
- Driver performance
- Vehicle activity
- Expense categories and invoice ageing
- CSV export and Print / PDF

Notifications and reminders

Move from reactive calls to managed exceptions

- In-app notifications cover assignments, failed inspections, document uploads and deliveries.
- Scheduled checks cover invoice due dates, compliance expiry, delayed loads and pending approvals.
- Email is provider-neutral through SMTP.
- A durable outbox tracks queued, sent, retry and failed states.
- Retry delays and reminder deduplication prevent repeated hourly messages.
- Without SMTP credentials, messages safely remain queued for testing.

Settings tab

Account, company and communications administration

- Profile: Google identity, email and active role.
- Company information: organization, industry, country and timezone.
- Organization access: invite members, assign roles, update roles, remove members and revoke invitations.
- Notification preferences and email/reminder configuration.
- Email outbox visibility and manual reminder scan controls.
- Organization switcher for users belonging to more than one tenant.

End-to-end business flow

The strongest story to demonstrate

1 Customer > 2 Locations > 3 Load > 4 Approve & schedule > 5 Allocate > 6 Driver executes > 7 POD > 8 Invoice
> 9 Payment > 10 Profit report

One connected chain: demand -> dispatch -> delivery -> cash -> insight.

Recommended live demo - 15 minutes

A reliable sequence that tells one complete story

0-2 min - Landing page, Google sign-in, organization and Overview

2-5 min - Loads: customer/location -> create sample load -> progress to Scheduled

5-7 min - Fleet/Drivers readiness -> allocate load -> linked trip

7-10 min - Driver portal: accept, inspection, start, milestones and POD

10-12 min - Tracking and Compliance exception controls

12-14 min - Finance: quotation/invoice/payment; Trip Costs approval

14-15 min - Reports, exports, roles and closing value statement

Pre-demo checklist

Complete these before the client joins

- ☐ Backend starts and /docs opens
- ☐ Frontend starts and Google login succeeds
- ☐ Owner account and organization are correct
- ☐ One customer with two mapped locations
- ☐ One available driver linked to a driver login
- ☐ One available vehicle with enough capacity
- ☐ Compliance documents valid for allocation
- ☐ One sample load at each useful lifecycle stage
- ☐ Browser location permission tested
- ☐ Finance and expense sample records prepared
- ☐ SMTP limitation understood; no secrets visible
- ☐ Backup screenshots / this PDF ready

Demo data to prepare

Use realistic but fictional information

Record | Suggested example

Customer | Acme Retail Pvt Ltd

Pickup | Mumbai Distribution Centre

Delivery | Pune Central Warehouse

Load | BML-DEMO-001 | Packaged goods | 10 tons

Vehicle | MH12AB1234 | 25-ton truck | Available

Driver | Ramesh Kumar | Valid licence | Available

Quotation | Base freight + fuel + toll + tax

Expense | Fuel receipt + toll charge

POD | Recipient: Demo Receiver | OTP or signature

Current boundaries and production readiness

What is included—and what requires deployment configuration

- Included now:

- Role-protected multi-tenant workflows
- SQLite demo / PostgreSQL support
- Google login, auditing and migrations
- Live reports, exports and background reminders

- Configure for production:

- HTTPS and secure cookies
- Production Google OAuth origins
- Managed PostgreSQL and backups
- SMTP provider and sender identity
- Managed/self-hosted geocoding for scale

- Known presentation notes:

- GPS depends on browser/device permission
- Payments are manually recorded, not processed
- SMS/Twilio is marked as coming soon
- Some Settings quick actions are placeholders

Client discovery questions

Turn the demo into a requirements conversation

- How many branches, dispatchers, vehicles, drivers and daily loads?
- Own fleet, outsourced transporters, or both?
- Who approves loads, expenses and invoices today?
- Which documents and expiry rules are mandatory?
- What tracking frequency and alert thresholds are expected?
- Which accounting, ERP, GPS, email or payment systems need integration?
- Which reports and KPIs matter to management?
- What are the rollout, hosting, security and data-migration expectations?

THANK YOU

From load request to profitable delivery

BookMyLoad connects planning, execution, compliance and cash visibility in one workflow.
